Open-source Tool Report: MALTEGO

I use the Maltego tool, which makes data collection functions fast, effective and visually based. It gives the user a high level of capability and speed in data collection, especially with tool integrations. At the same time, since it presents information through visual schema, it becomes simpler to classify the data obtained and to reveal the relationships. With Maltego, you can discover the target network on a single platform, and you can quickly and effectively obtain a lot of data such as corporate information, information about the products and services used, employee credentials, news about the target organization in the past, and information documentation about possible vulnerabilities in the system.
